Claim 42; Page 97-99; 194pp; Japanese.

target cell.

The present sequence is a human fibronectin fragment containing a CS-I binding domain, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral

Synthetic functional polypeptide to promote wound healing, etc. - contg. cell adhesion polypeptide from fibronectin and fibroblast growth factor polypeptide, opt. linked by spacer.
                                                                                   The sequences given in AAR40158-63 represent human fibronectin (FN) and fibroblast cell growth factor (FGF) fragments which were used in the production of fusion polypeptides which are able to stimulate cell adhesion and cell growth. These fusion peptides may be used for antiaging cosmetics and in wound healing after surgery
                                                                                                                                                                                                                                                                   VPRDLEVVAATPTSLLISWDAPAVTVRYYRITYGETGGNSPVQEFTVPGSKSTATISGLK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              420
                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                              oligopeptide, which was used in the development of a novel method for increasing the efficiency of gene introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence of a retrovirus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for the gene therapy of cancer and viral diseases, e.g. AIDS

                                                                                                                                                          This sequence represents a fibronectin receptor that can be used in the method of the invention. The method is for the control of human fimunodeficitency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection of HIV. The method is used to control HIV-infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PGTEYVVSVSSVYEQHESTPLRGRQKTGLDSPTGIDFSDITANSFTVHWIAPRATITGYR

```
The invention relates to novel drugs containing a gene encoding a polypeptide which has the amino acid sequence of a polypeptide having a cell adhesion activity and another polypeptide with an amino acid sequence of a polypeptide having a fibroblast growth factor activity. The drugs of the invention have cardiant, and osteopathic activity. The gene therapeutics of the invention are applicable in angiogenesis promocion and treatment of arterial diseases and cartilage damage. The sequence represents the human SC-FGF protein, a fusion of FGF-4 signal and C-FGF
 Gene therapeutics to provide fusion polypeptide with cell adhesion and fibroblast growth factor activities, applicable in angiogenesis promotion and treatment of arterial diseases and cartilage damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; drug; cell adhesion; fibroblast growth factor; FGF; cardiant; osteopathic; angiogenesis promotion; arterial disease; cartilage damage; sC-FGF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel drugs containing a gene encoding a polypeptide which has the amino acid sequence of a polypeptide having a cell adhesion activity and another polypeptide with an amino acid sequence of a polypeptide having a fibroblast growth factor activity. The drugs of the invention have cardiant, and osteopathic activity. The gene therapeutics of the invention are applicable in anglogenesis promotion and treatment of arterial diseases and cartilage damage. The sequence represents the human C-FGF protein, a fusion of C277 and bFGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gene therapeutics to provide fusion polypeptide with cell adhesion and fibroblast growth factor activities, applicable in angiogenesis promotion and treatment of arterial diseases and cartilage damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300

These fusion peptides may be used for antiaging cosmetics and in wound healing after surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

All the peptides of the invention contain an RGDS motif. The inhibitor can be used as a therapeutic and diagnostic agent for AIDS and cancers. (See also AAR60343-47). (Updated on 16-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                              This functional fibronectin (FN) polypeptide has the formula: C(277)-(Met)n-H(271)-X; where C(277)= the FN cell-binding domain fragment [Pro(1239]-Ser(1515)], H(271)= the FN heparin-binding domain fragment [Ala(1690) Thr(1960)], X= peptide chain of 25 residues, and n= 0 or 1. The linker amino acid, Met, can be deleted. It is produced by recombinant methods, in large quanti- ties and is useful in an agent for inhibiting angiogenesis. It may be useful in prevention of metastasis and tumour growth, as a con-traceptive, for the treatment of e.g. osteoporosis, retinopathy and rheumatism and to inhibit the spread of foci in psoriasis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                 14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The present sequence is the oligopeptide CH-296, which was used in the development of a novel method for increasing the efficiency of gene	introduction into a target cell using a retroviral vector. The method comprises carrying out viral infection of the target cell in the presence	or a retrovitus and target cell binding substance or substances. The method can be used to effectively introduce genes into target cells for	the gene therapy of cancer and vital diseases, e.g. AIDS	5/4 AA;	query match. Query match Similarity 58.0%; Pered.                                                                                                                              This sequence represents a fibronectin receptor that can be used in t method of the invention. The method is for the control of human immunodeficiency virus (HIV) infection using a composition which comprises a functional substance which participates in the infection HIV. The method is used to control HIV-infection
                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             457

The present invention relates to a method for inducing cytotoxic T-cells incubating antigen-specific cytotoxicity. The method comprises incubating cells capable of differentiating into CTL with a cellular or non-cellular antigen in the presence of a substance having one of the following properties: (1) binding to CD44; (2) regulating the signal generated by CD44 binding to its ligand, (3) inhibiting binding of a growth factor to its receptor; (4) regulating the signal generated by growth factor binding to its receptor; (5) containing fibronectin and/or its fragments. Antigen-specific CTL are used for the treatment of cancer and bacterial and viral infections. The present sequence is a fragment of human fibronectin, which was used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PGTEYVVSVSSVYEQHESTPLRGRQKTGLDSPTGIDFSDITANSFTVHWIAPRATITGYR 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       KYEVSVYALKD---TLTSRPAQGVVTTLENVSPPRRARVTDATETTITISWRTKTETITG 401
                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for transferring a gene into target cells by a retrovirus using a serum-free medium. The culture medium of the target cells is serum free and contains an effective amount of a functional substance to elevate the gene transfer efficiency when both the retrovirus and target cells are present together. The gene transfer method is useful in medical sciences, cell engineering and genetic engineering, such as in the treatment of AIDS and cancers e.g. leukaemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                               Gene transfer by retrovirus in medium containing functional substance optionally low-density lipoprotein - useful in medical sciences, cell gene engineering, particularly for treating AIDS and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTDLRFTNIGPDTWRVTWAPPPSIDLTNFLVRYSPVKNEEDVAELSISPSDNAVVLTNLL

results showed that those cells subjected to fibronectin fragments and antic CD3 antibody during the early and middle phase of induction had a higher ratio of CD8 positive cells than in the control cells. The current sequence represents a fibronectin fragment of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 5, 7

Sequence 9, Application US/07959369;
Patent No. 5302701
GENERAL INFORMATION:
APPLICANT: Hidetake HASHI et al.
TITLE OF INVENTION: No. 5302701el Functional Polypeptide
NUMBER OF SEQUENCES: 23
CORRESPONDENCE ADDRESS:
ADDRESSEE: Wenderoth, Lind & Ponack
STREET: 805 Fifteenth Street, N.W., #700
CITY: Washington
STATE: D.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STATE: D.C.

Patent No. 647204

GENERAL INFORMATION:

APPLICANT: Asada, Kiyozo

APPLICANT: Usmori, Takashi

APPLICANT: Koyama, No. 6472204uto

APPLICANT: Hashino, Kimikazu

APPLICANT: Rato, Ikunoshin

ITILE OF INVENTION: METHOD FOR GENE TRANSFER INTO TARGET

ITILE OF INVENTION: CELLS WITH RETROVIRUS

NUMBER OF SEQUENCES: 39

CORRESPONDENCE: 39
